

Las Lajas Micromill - Finca Calle San Juan - Red Honey (GrainPro)

Oscar and Francisca Chacon of Las Lajas Micromill are third-generation coffee producers who are committed to quality and innovation, and are probably best known for being among the first to produce honey coffees in Costa Rica. The micromill is also one of the only certified-organic mills in the area, and the Chacons take their environmental impact very seriously.

As average temperatures rise and the weather patterns change, the Chacons are considering adding more shade trees to their farm to moderate the heat, and to add irrigation systems to combat the inconsistent rainy seasons Costa Rica has had the past few years. To mitigate their water usage, Don Oscar uses a Penagos demucilaginador to depulp his coffee, and since the coffees are all natural or honey process, very little water is used at the mill.

Harvesting and processing are overseen with great care by both Don Oscar and Doña Francisca: During the harvest, Doña Francisca will measure the Brix of the cherry to determine the optimal ripeness, and picking will begin when the Brix reads about 22°. Harvesting by Brix reading is also helpful as newer varieties sometimes ripen to different colors: Using the refractometer helps keep the harvest

ID# 10549

| | |
|------------------|-----------------------|
| Origin | Costa Rica |
| Region | Sabanilla de Alajuela |
| Farm | Finca Calle San Juan |
| Variety | Caturra, Catuai |
| Altitude | 1450 masl |
| Proc. Method | Red Honey |
| Harvest Schedule | January- March |

The Cup

" Sweet with tart winey acidity and a creamy mouthfeel; lots of cherry and lime flavor with berry, cola, dried fruit and cocoa."

at uniform ripeness, which is key when producing high-quality naturals and honeys.

Las Lajas began producing honey coffees in 2008, after an earthquake cut off the mill's access to water for several weeks. Don Oscar had heard that in Brazil and Ethiopia they use pulped-natural and natural techniques to process coffees, so he tried it with his harvest that year. Around that same time, Café Imports founder and president Andrew Miller visited the area, and was so impressed by the flavor of the Chacons' coffee he became one of the first buyers of the new process. Don Oscar believes that just as the roast profile will change the flavor of a coffee, the drying curve also has an impact. He wants the drying to happen slowly, which means that production is necessarily limited.

The Chacons produce several different types of honeys and naturals: For their honeys, 100% of the mucilage is left on the coffee, and the coffee is dried in different ways. The Chacons determine which process to use based on the weather on the day the coffee is harvested.

- **Yellow Honey:** Coffee is turned hourly on raised beds.
- **Red Honey:** Coffee is turned several times a day on the beds, but not as frequently as for yellow honey.
- **Black Honey:** The coffee is only turned once per day.

The Chacons also do three natural processes.

- **Perla Negra:** Dries directly in the sun for 10 days, rotating constantly, then transferred to bags and left for 2–3 days before being finished on the raised beds.
- **Alma Negra:** Drying starts on the patio, then the coffee is piled overnight and spread out in the sun during the day.
- **Diamonda Negra:** This new process is dried completely in piles in the greenhouse.
